MYOS was developed by **TOKY Branding + Design**, one of the U.S.'s most award-winning web design firms. As branding and design specialists, we're focused on helping clients and their brands stand apart from their competition.

We've been disappointed by existing CMS solutions that force brands to limit the creation of truly unique online experiences. With MYOS, you can now have an easy-to-use content-managed site that enables custom design and real brand differentiation.

MYOS provides many of the same features and functionality of standard CMS programs currently available — without forcing your site to look like all of the other template-based sites on the Web.

It's your site: Why work with a limiting solution that holds back its potential?

Web-Based Administration

Your website can be updated using a Web browser, making it possible to completely manage your site from any computer, with no additional software required. MYOS has been tested and verified in Firefox 2+, Safari 2+ and IE 7+.

WYSIWYG Editor

MYOS features a WYSIWYG (What You See Is What You Get) editor that allows users to add content as they would in a word processing program, without HTML coding knowledge and experience.

User-Friendly URLs

MYOS uses Apache's mod_rewrite to allow for custom URLs that are both user-friendly and search-engine friendly. No longer will your URLs be a string of hard-to-remember characters - you can customize the URLs to exactly what works for you.

SEO Friendly

MYOS allows you to easily control the metadata for every page of your site so you can properly optimize pages for better search engine rankings.

Media Library

All of your website's digital assets — including images, documents and videos — are stored in your media library. Once uploaded, these assets are available for use everywhere in your website.

Drag-and-Drop Navigation

Once a page has been published, it can be moved around in the site navigation with an easy-to-use drag and drop tool.

Integration with Third-Party Tools

MYOS can easily integrate with third-party tools such as Google™ Site Search, Yahoo!™ Search, Google™ Analytics, and WordPress™.

User Role Management

Administrators can assign user roles to individual content managers with various levels of permission, allowing custom authority over what content can be accessed, edited and approved.
